# Environmental monitoring

Readings for water, soil, and air in laboratory and field processed, stored, sent and processed automatically

Possibilities and concepts for your measuring tasks - and a simple way for your data from the field to your desktop

## Data acquisition

### Single sensors optionally with logger

e.g. enviLog Mini 1 to 2 parameters simultaneously  
(e.g. temperature, rH/T, water level)

### Measuring stations

enviLog Midi/Maxi with connected sensors  
diverse parameters, up to 48 channels

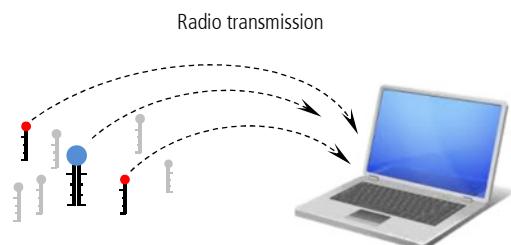

### Monitoring networks

Measuring stations with „satellite“-Loggers  
= enviLog Midi/Maxi & enviLog Mini

## Data transfer

### A) Radio transmission (433 MHz)

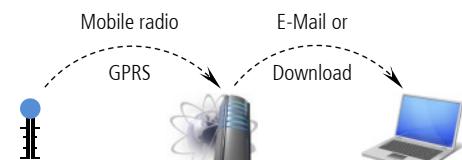

via USB-radio transmission receiver/-transmitter.  
Application mainly for single sensors

One or several enviLogs transfer the data directly to the PC

### B) Mobile radio (GPRS)

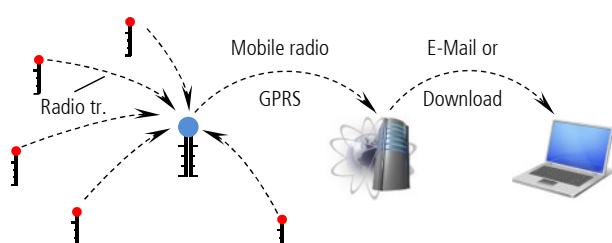

Application mainly for measuring stations

enviLog with modem sends data via www-server to PC

### C) Monitoring networks (combination of A & B)

Application for measuring stations  
& monitoring networks possible

enviLog Mini send data to enviLog Maxi with modem, then process as above (B)

## Data safety

Triple data backup by storage on three memory media:

## Data processing

### A) Spreadsheet analysis

### B) enviWatch data base

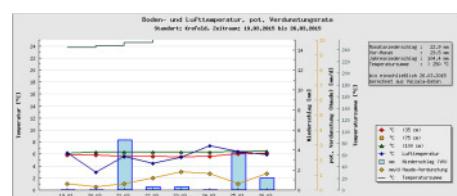

Automatic management, processing and presentation  
via ecoTech data base server (customized)

### C) User-owned data base

Automatic management, processing and presentation  
via customer's data base server

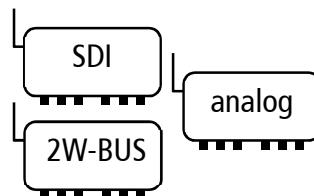

Example: Geological Survey North Rhine-Westphalia NRW

## Data logger extension modules

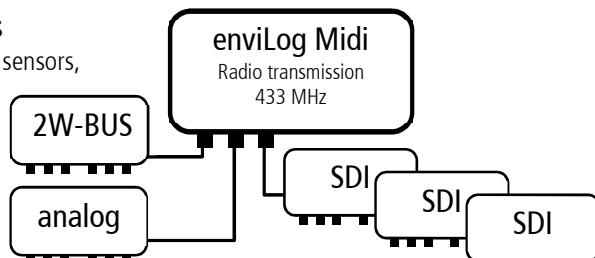

### Extension modules for more sensors

- a) SDI-12 with 7 sockets, cascadable
- b) analog with 6 differential inputs
- c) 2W-BUS-interface

### Example stations

- A) Setup with up to 48 sensors,  
different sensor  
types combinable

- B) Central data logger with satellite units for subplots,  
distance up to 100 m
